	Urgent	Not Urgent
Important	Do - ● Create a file that represents the outline of the graph row y column x. A ○ The x and y will represent column/row 1 to 1. ● Uses awk with spaces as regex to place the special characters on the file outline of the graph using a given list of x and y. ○ Outline is going to have one character representing white space and another character representing datapoint, separated with white space. ● Use awk and bash format to turn rough outline of graph into graph printed to terminal. The data points will be green and white space will black. ● The graph will be made with unicode character U0002588	Schedule - (For V2.0+) ● Allow the user to input a function and automatically find the x and y. ● Uses a java program. ● Allow for specific flags to set the columnSize, min/max x and y. ● Have the ability to scale graphs so x and y isn't 1:1 to column and row.
Not Important	Delegate - (Use a library) ● Use built in Bash commands like echo and awk. ● Uses the java IO library to get input from users. ● Use Bash formatting to change text color.	Delete - (Cut it) ● Make a graph from curled data. ● Ability to graph and compare multiple functions. ● Ability to make graph from dataset and not just function. ● A separate java program that will print a summary like mean, median of dataset. ● Make the graph look pretty
